

How long would it take to implement the solution?

I estimate it will take me approximately four (4) hours.

How much effort (in person hours) did it take to complete the entire work?

It took approximately 3 hours and 20 mins to complete the task.

How well did your solution match the problem?

My solution does as the task requires, which is that it takes numerical input and calculates their average. And my solution does this accurately.

How good is your work?

Assuming the standard for my work to be "good" is for it to be accurate and contain all specified program requirements, then yes, my work is good.

If the standard of "good" work in this case refers to methodology or technique, then it is likely that there are likely several ways to design this program that would require less lines, less time, and allowed for unit testing to be done easier/more efficiently.

How many test cases will you require?

I will need 5 test cases: 1 test for each unit and 1 for the program as a whole.
